- COMMON EASEMENT E (J-S5)

Appendix CStreet Capacity (Local Streets)

Appendix D Public Right-of-Way Drainage Improvements

- INLET CALCULATIONS
- HYDRAULIC CALCULATIONS WEST LOOP ROAD
- CULVERT CAPACITY (J-C26, J-N5, J-N25, J-H, & J-N2)

Appendix E Base Flood Elevations (Hec-RAS output)

Appendix F Plans - Not Included with this Study (See Grading Plans this Project)

1. GENERAL LOCATION AND DEVELOPMENT DESCRIPTION

1.1. Introduction

This study is submitted as the technical drainage study for the proposed improvement plans of Area 3, of the Golden Valley Ranch residential development located in the Sacramento Valley of Mohave County, Arizona, more specifically on the south side of the Golden Valley Community, near Kingman. Area 3 comprises of approximately 90 acres of the total 5,800 acres of land located in the Golden Valley Ranch.

The purpose of this study is to evaluate the storm drainage infrastructure of the proposed Area 3 development.

This study is divided into four separate areas of consideration. They are as follows:

- A general overview of site drainage
- A detailed analysis of the proposed storm drainage infrastructure.
- An analysis of the drainage improvements in the Public Right-of-Way.
- An evaluation of interim facilities serving the site

1.2. Location

The Golden Valley Ranch project site consists of Taxpin Numbers 215-01-048, 215-01-075, 215-01-078, 215-01-079, 215-01-080, 215-01-084, 215-01-085, 215-01-092, & 215-15-005 within Township 20 North, Range 18 West and Township 21 North, and Range 18 West, G&SRM, Mohave County, Arizona (Figure 1 - Vicinity Map and Regional Drainage Scheme).

1.3. FEMA Flood Hazard Zone

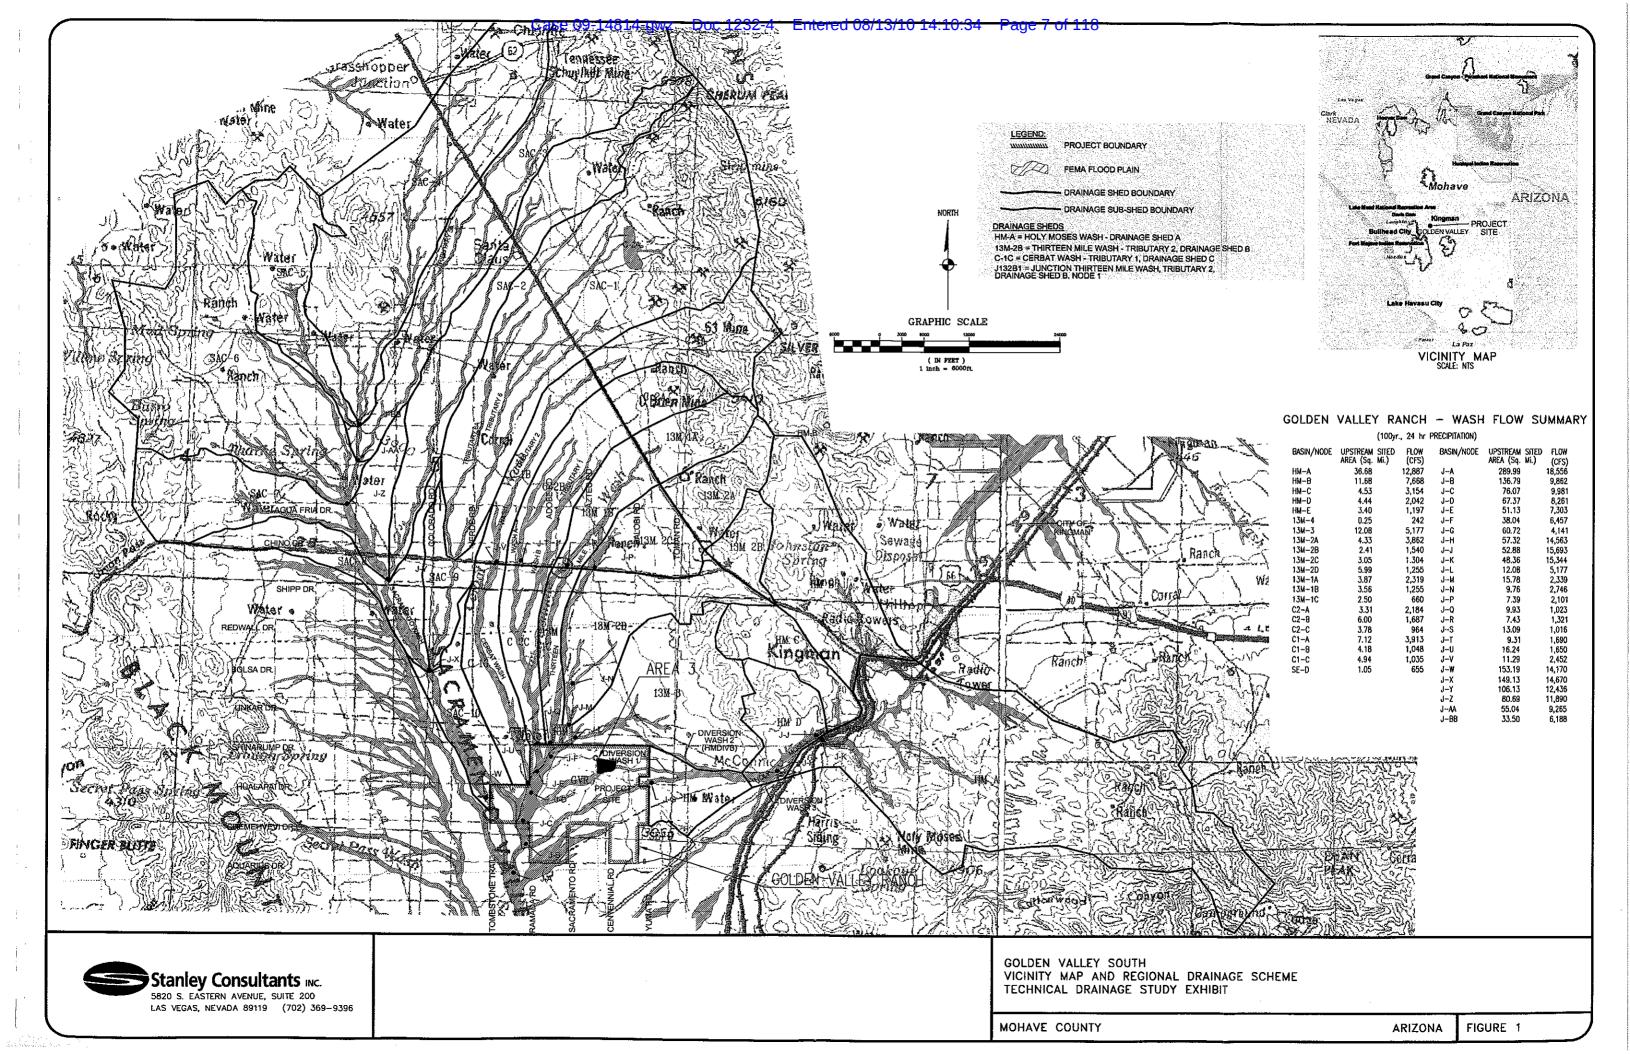

Figure 2 is a representation of the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM) for Mohave County, AZ, map number 040058 2325C, dated October 20, 2000. Of the 205 acres of Area 1, 22 acres lies in Special Flood Hazard Zone A.

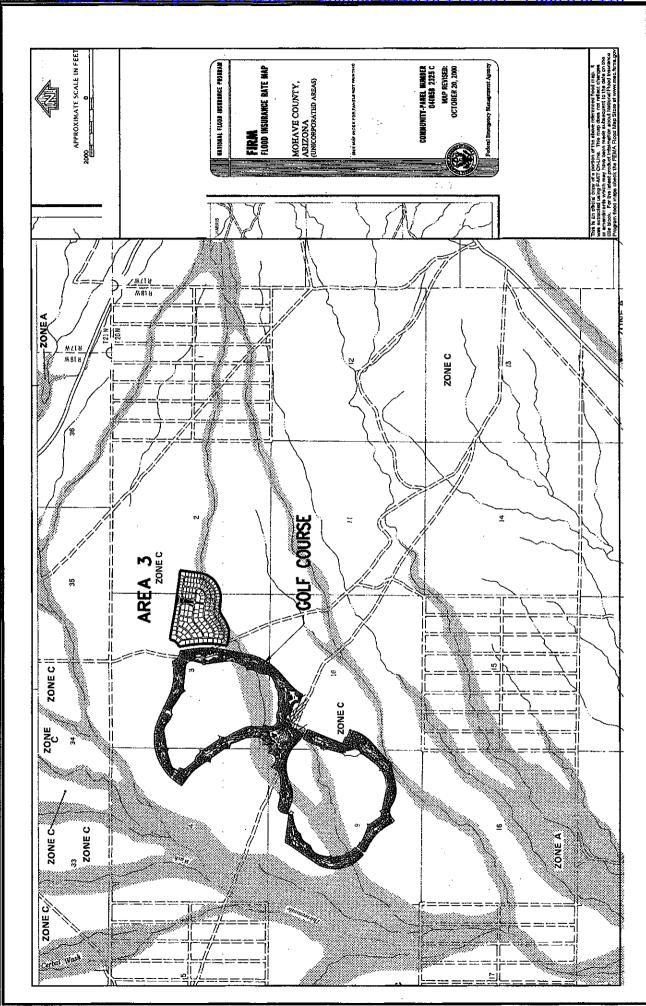

Zone A is the flood insurance rate zone that corresponds to the 100-year floodplains that are determined in the Flood Insurance Study (FIS) by approximate methods. Because detailed hydraulic analyses are not performed for such areas, no Base Flood Elevations (BFE's) or depths are shown within this zone. Mandatory flood insurance purchase requirements apply.

2. SITE DESCRIPTION

2.1. Description of Property

The property is semiarid rangeland with a covering of desert shrub in poor condition. Area 3, is located generally in the southwest quadrant of Sections 2 and 3, Township 20 North, Range 18

West, G&SRM. The project will be developed into two residential communities consisting of single-family (12,000 square feet lots, and 6,000 to 7,000 square feet lots) residences, streets, and open spaces.

2.2. Drainage Descriptions

Area 3 is situated between the Thirteen Miles Wash and the Holy Moses Wash. Small braided channels traverse the site and a diversion channel from the Holy Moses Wash (Diversion Wash 1) crosses in a southwesterly direction across the site. The project lies on westerly sloping alluvial fan originating from the Cerbat Mountains.

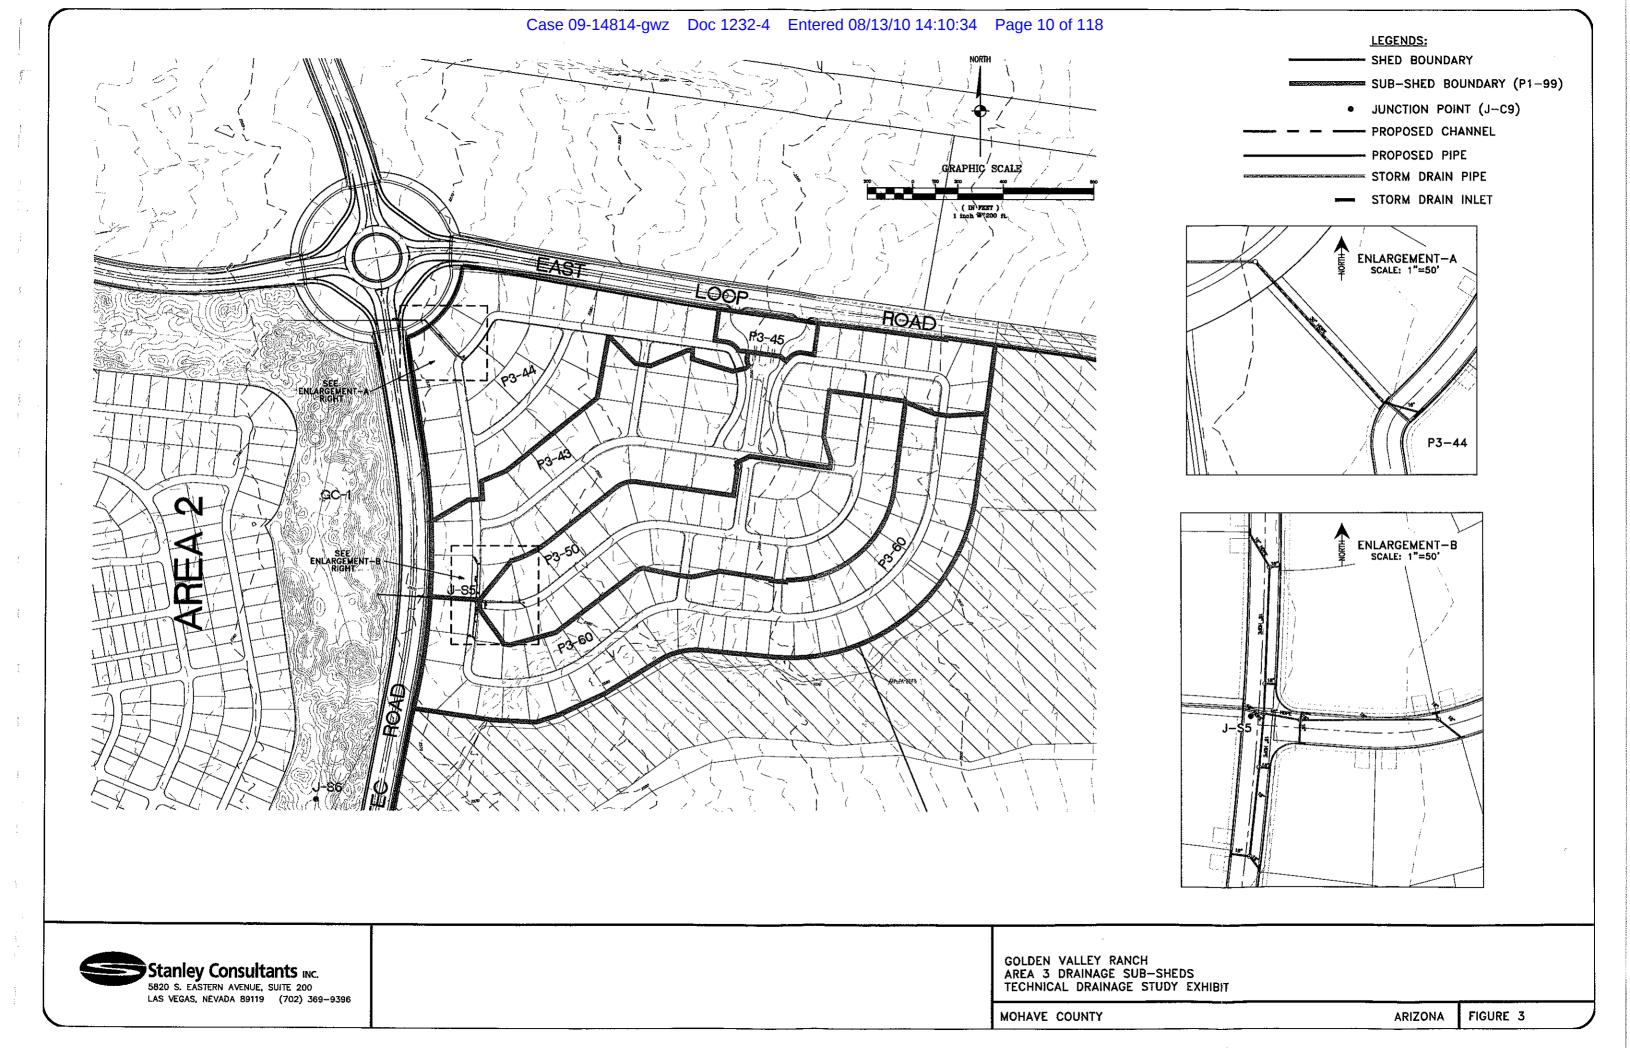

Rainfall runoff generated within the development travels from the individual residential lot or open space to the street. The street is the main mean of runoff conveyance until runoff exceeds street capacity. When that happens, runoff is received into an underground storm drainage system, into a drainage swale or channel. The storm drainage system is sized to convey a minimum of the 10-yr, 6-hr storm runoff. Runoff generally drains in a westerly direction toward Aztec Road. Area 3 has two release points that collect runoff, conveys it under Aztec Road, and releases it into the adjoining golf course. The storm drainage system is sized to capture the majority of the 100-yr, 6-hr precipitation, with minor amounts of runoff entering the Aztec Road right-of-way. Eventually, all runoff is combined and discharged into the Thirteen Mile Wash, a tributary of the Sacramento Wash.

Area 3 is divided into five small sub-sheds, ranging in size from 1.6 acres to 25.4 acres (See Figure 3). Runoff from Shed P3-44 (25 acres) discharges to the north into the golf course where it combines with runoff from Area 2 development and future Areas 62 and 63. A small shed (Shed P3-45) comprises of the Area 3 access from East Loop Road is approximately 1 acre and drains to the north where it combines with the East Loop Road drainage. The remaining 63 acres (P3-43, 50, and 60) combine at junction J-S5. Street flow from the three sub-sheds exceeds the street capacity at the intersection where it is received into a storm drainage system. The majority of flow is carried under Aztec Road and enters the golf course via a bubble-up structure. A small low flow pipe is connected to the golf course drainage system to maintain positive drainage at all times. An overland release is provided for runoff not received into the drainage system at J-S5 and enters Aztec Road.

3. METHODS AND CRITERIA

3.1. Methodology

The HEC-HMS model was used for the simulation of flood events in watersheds and river basins. This computer model simulates the surface runoff response of a drainage basin to precipitation by representing the basin as an interconnected system of hydrologic and hydraulic components. Each component models an aspect of the rainfall-runoff process within a portion of the whole basin. This basin portion is referred to as a sub-basin. The runoff hydrographs of each sub-basin are then combined and a final discharge hydrograph is obtained. It was chosen as the

hydrology model since it is the model used in a Preliminary Federal Insurance Study prepared for Mohave County Flood Control District, October 2005 for various watersheds in the Golden Valley and Kingman, AZ area. This adds consistency and reliability in the methodology. Modified-Puls routing in the HEC-HMS model allows for retardation of peak flows within the broad flood way of the golf course.

HEC-RAS, another program from the COE, provides a steady state flow analysis to determine water surface elevations within a defined channel or flood plain. Volume computations within the HEC-RAS program were utilized in developing flow routing by Modified-Puls methods.

Water Surface Pressure Gradient (WSPG) program developed by the Los Angeles County Flood Control District. WSPG is a similar program to HEC-RAS in that it develops the water surface elevations and other channel parameters, but is better adapted to closed (pressure) conduit flow and is therefore used in the evaluation of the stormwater infrastructure system.

Calculations for street capacity are produced using the FlowMaster by Haestad Methods, Inc. Inlet calculations are performed using Federal Highway Administration's Visual Urban program for pavement drainage.

3.2. Drainage Shed and Modeling Convention

The basic naming convention of the basins for the exhibits and model are based around the individual drainage shed of the development. Sheds are labeled as P3-44, identifying Area 3, Shed 44. Junction points or points of runoff confluence are identified as J-S5, identifying that it is a junction point and a label. An R designates a routing of a shed or junction, therefore R-JS5 represents routing of junction J-S5 to another point.

3.3. Design Storm and Precipitation

Local jurisdiction requires that water sheds less than 20 square miles be evaluated for the 6-hour local storm. Drainage sheds of 20 to 100 square miles are to be evaluated for both the 6-hour and 24-hour rainfall events. Areas from 20 square miles to 500 square miles are considered general storms and are evaluated for the 24-hour precipitation.

Maricopa County Flood Control District has developed storm distribution curves associated with drainage shed size. Since the total area of Area 3, is less than 1 square mile, Pattern 1 of the Maricopa County 6-Hour Mass Curve was utilized for the storm distribution. Precipitation values of 3.00-inches and 1.76-inches were taken from the National Oceanographic and Atmospheric Administration National Weather Service's Atlas 14. Table 1 provides the precipitation values from NOAA Atlas 14. Since the total area of Area 3 is 0.14 square miles (90 acres) the depth-area reduction factor was not applied.

Table 1 - Precipitation

| Recurrence | 5 min | 10-min | 15-min | 30-min | 1-hr | 2-hr | 3-hr | 6-hr |
|----------------|-------|--------|--------|--------|------|------|------|------|
| Interval (yrs) | | | | | | | | |
| 10-yr | 0.40 | 0.61 | 0.75 | 1.01 | 1.25 | 1.44 | 1.53 | 1.76 |
| 100-yr | 0.65 | 0.98 | 1.22 | 1.64 | 2.03 | 2.44 | 2.67 | 3.00 |

3.4. Soils

Soils information is taken from the Natural Resources Conservation Service, Soil Data Mart. Soils within Area 1, Phases A & B consist of CACIQUE-BUCKLEBAR-ALKO (AZ039) type. These soils have a hydrologic soil type designation of "C".

3.5. Model Data and Results

Table 2 summarizes runoff at junction points and drainage sheds within Area 3. Runoff values are rounded to the nearest 1 cfs.

Table 2 - Flow Summary

| Element | Area (sq mi) | Peak Discharge 100-yr (cfs) | Peak Discharge 10-yr (cfs) |
|---------|--------------|--------------------------------|-------------------------------|
| J-S5 | 0.1092 | 187 | 64 |
| P3-43 | 0.0393 | 60 | 16 |
| P3-44 | 0.0281 | 38 | 10 |
| P3-45 | 0.0025 | 5 | 1 |
| P3-50 | 0.0303 | 59 | 22 |
| P3-60 | 0.0396 | 71 | 26 |

It should be noted that the precipitation depths of the 100-yr, 6-hr event is 3-inches and that the precipitation depth of the 10-yr, 6-hr storm is 1.53-inches. The 100-yr precipitation is nearly twice for the 10-yr event. For the same events the amount of excess precipitation available for runoff is dependent on the runoff curve number, which is a function of soil type, land use, and antecedent moisture conditions. For this reason a larger portion of the 100-yr precipitation is available for runoff than for the smaller 10-yr storm and the ratio of peak runoff for the 100-yr precipitation to 10-yr precipitations is nearly 3.

All model results and input data are found in the Appendices of this study. They consist of the following:

- Appendix A Model Results and Data provides the input parameters and results for Area 3, sheds.
- Appendix B Drainage Infrastructure provides the storm drain inlet calculations open channel flow calculations through utility easements.
- Appendix C Street Capacity Calculations
- Appendix D Public Right-of-Way Drainage Improvements

4. Drainage Improvements within the Public Right-of-Way

Access to the project site is via Shinarump Road from the north to the new Aztec Road alignment and the East Loop Road. No improvements are anticipated between the Area 3 entrance and the intersection with Aztec Road.

Aztec Road will receive a culvert crossing at the Power line Easement to convey runoff from offsite areas to the Thirteen Mile Wash. The West Loop Road, west of Area 3 will have a pipe crossing from the Open Space area of Area 1, Phase 1 and convey this and other Area 1, Phases 1 & 2 runoff south, crossing a future portion of the West Loop Road and discharging into the golf course (See Figure 4). Discharge from Area 1, Phases A & B drainage sheds are discussed in Section 2.2 of the Drainage Study of Area 1, Phases A & B.

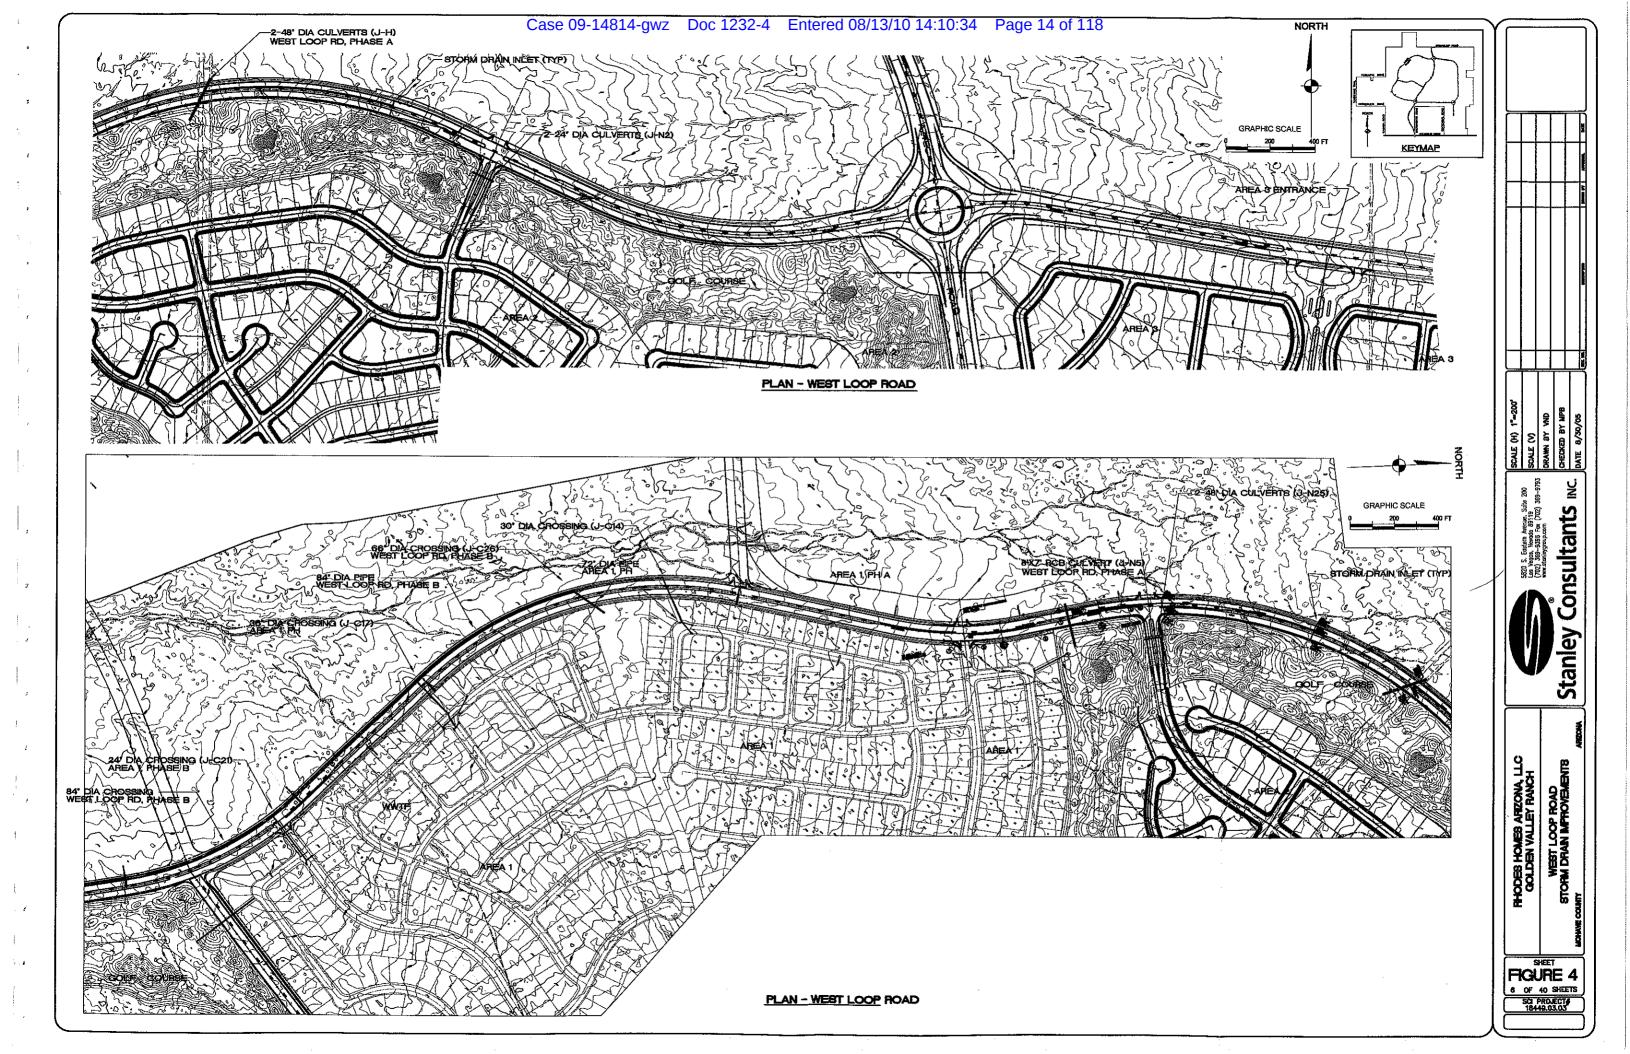

Appendix D contains street capacity calculations for the arterial roads and inlet capacity calculations.

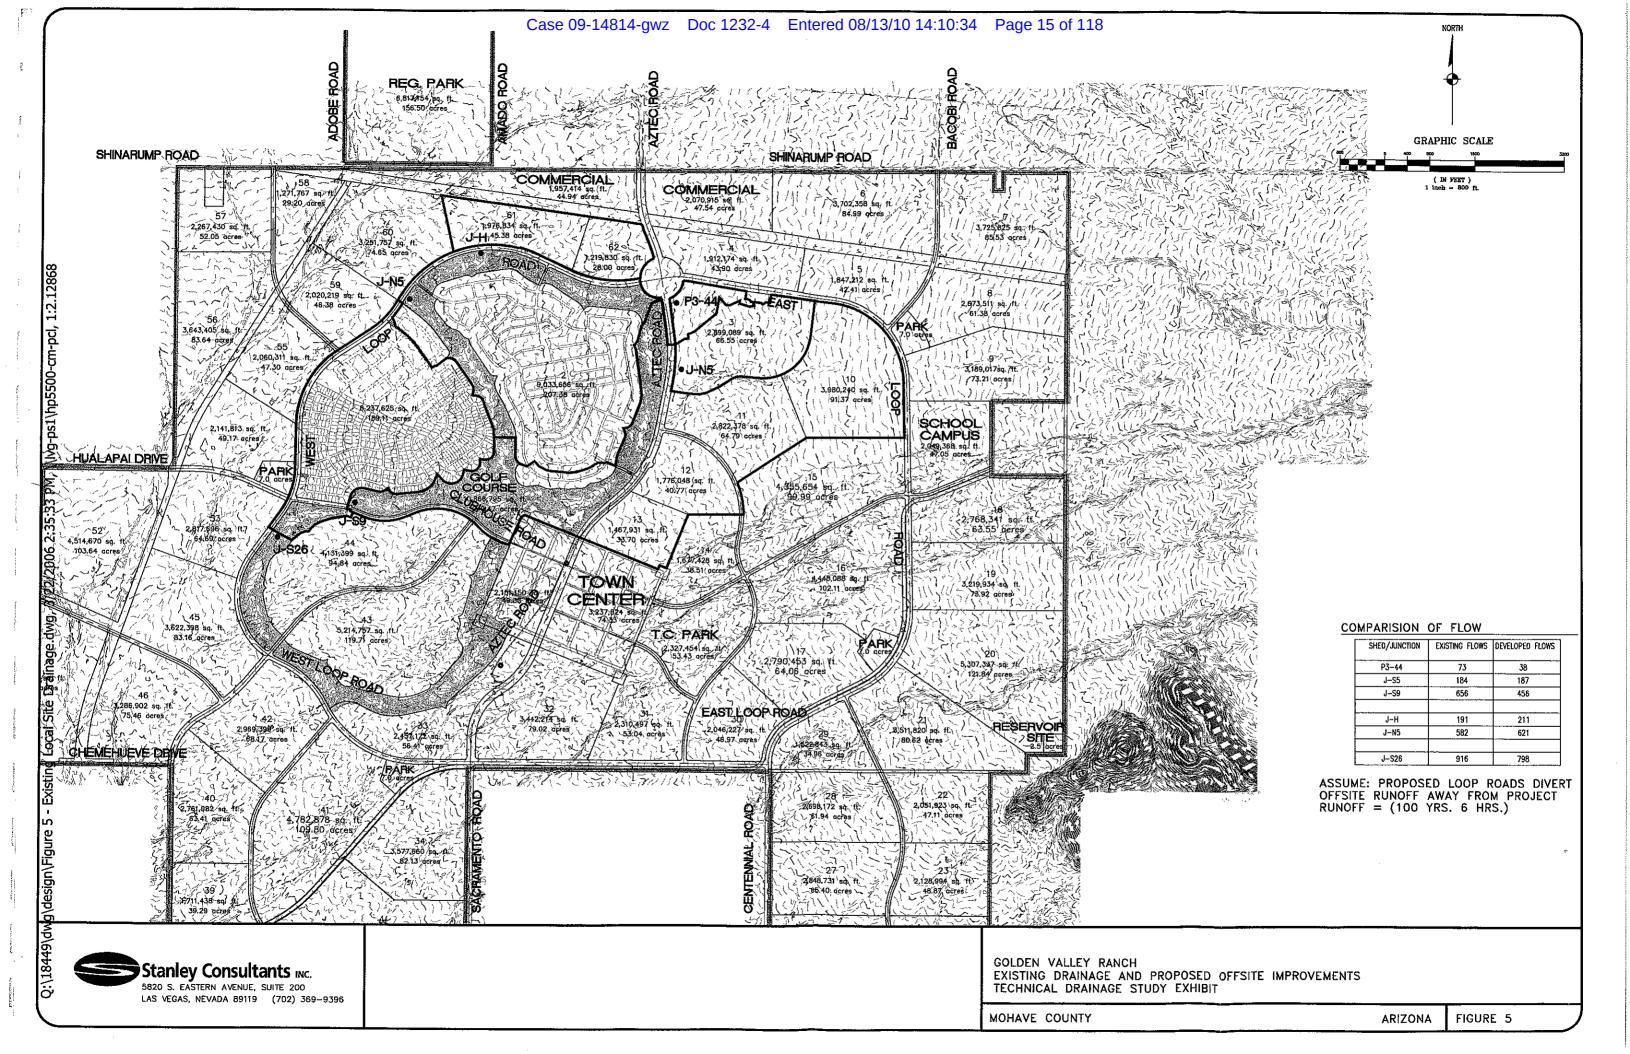

5. Comparison of Flows

The drainage shed characteristics change with development of existing lands. The pervious soils that formerly existed become less pervious with the addition of houses, streets, and sidewalks and the time for runoff to reach its release point shortens. From a drainage point of view, one of the major advantages to the adjacent golf course is that drainage runoff is routed through its fairway system. This not only allows for runoff of the major storm events, but also allows for the golf course to absorb some for the runoff volume, therefore reducing the peak flow. Figure 5 shows existing drainage as it relates to the Area 1-3 development and outside areas that will drain through the proposed system. Table 3 provides a comparison of existing flows to developed flow at major junction points. Note that runoff from the northern release point J-N5 exceeds its existing flow into the Thirteen Mile Wash, the collective flows from J-N5 and J-S26 less than existing due to detention provided within the golf course.

Table 3 – Flow Comparison

| Shed | Area (acres) | Indirect Methods (cfs) | HEC-HMS (cfs) |
|-------|--------------|------------------------|---------------|
| J-H | 73.26 | 191 | 211 |
| J3-44 | 18.12 | 73 | 38 |
| J-S5 | 69.79 | 184 | 187 |
| J-S9 | 439.35 | 657 | 456 |
| J-N5 | 369.78 | 582 | 621 |
| J-S26 | 713.82 | 916 | 798 |

6. FEMA Base Flood Elevations

The Holy Moses Diversion Wash #1 leaves the main channel east of the site. It travels in a westerly direction along the westerly sloping alluvial fan. The runoff generally remains within the washes banks, but as it reaches the channel edge it spills over into the surrounding dessert plain. Overtime the cresting and release of flow along with its sediment load has formed a channel with overbanks sloping away from the channel.

A HEC-RAS analysis provides the Base Flood Elevations (BFE) for this diversion wash. The base flood flow within Holy Moses Diversion Wash # 1 is based on derived flow from the Technical Drainage Study for Golden Valley Ranch, Mohave, Arizona, dated October 2005. Finish building grades are developed to remain 1 foot to 1.5 feet above the BFE. Figure 6 shows the BFE's for development in Areas 1-3.

7. SUMMARY

This study develops specific criteria and flow for the development of Area 1, Phases A & B.

- The majority of the development runoff can be maintained and conveyed within the street right-of-way. Where street flow capacity is reached, a storm drainage system is required.
- The drainage infrastructure is capable of conveying the 10-yr, 6-hr storm event (minimum).
- The adjacent golf course services as runoff conveyance and storage.
- Total discharge from the collective Areas 1-3 to the Thirteen Mile Wash is less because of the use of runoff volume storage provided in the golf course.
- Conveyance of stormwater runoff within the golf course fairways allows for some ground water recharge.
